Subject: Coresta

Your message was transmitted to Manuel, who is presently attending a course at Mont Pellerin.

Between you and me, what is the issue ? Industry wanted to have anchored in CORESTA the notion of an error range for tar values of 15 percent but of at least 1 mg.

This means that the lower limit of detection is - for arithmetic reasons - 2 mg. (If one obtains the numerical result of 1 mg in a laboratory test, one has to add the 1 mg error, so as to determine the boundaries of certainty, which gives you 2 mg. Readings below 2 mg are therefore inadmissible).

Kind regards, Helmut
